

VELA

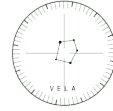

PRIVATE COMMAND INFRASTRUCTURE

Operations & Reference Guide

System architecture, agent roster, commands, and maintenance.

Your judgment. Our infrastructure.

Version 2.0 · March 2026

01 System Overview

Agent ID	Role	Model
cos	{{AGENT_NAME}} — Chief of Staff	claude-sonnet-4-6
analyst	Financial models & data analysis	claude-sonnet-4-6
marketing	Copy, positioning & campaigns	claude-sonnet-4-6
legal	Contract review & risk flagging	claude-sonnet-4-6
pm	Project tracking & deadlines	ollama/qwen2.5:7b (local — free)
researcher	Deep research & intelligence briefs	ollama/qwen2.5:7b (local — free)

Configuration Item	Value
Cache retention	short (5 min TTL) — reduces token costs significantly
Context window	200,000 tokens per session
Session reset	3am + 2pm daily — keeps context lean
Config file	~/openclaw/openclaw.json
API keys	~/openclaw/.env (chmod 600)
Workspace files	~/openclaw/workspace-{{agent}}/
Logs	~/openclaw/logs/
License config	~/openclaw/vela_client.conf

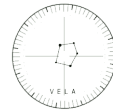

02 Daily Operations

Talking to {{AGENT_NAME}}

Open Telegram and message your configured bot. {{AGENT_NAME}} handles all incoming messages — responds directly or dispatches to a specialist and returns results.

- Give {{AGENT_NAME}} one task per session for best results
- Type /new before switching to a new topic
- Be specific — the more context, the better the output

03 Gateway Management

OPERATIONS & REFERENCE GUIDE

```
# Check status

openclaw gateway status

# Start / stop / restart

openclaw gateway start
openclaw gateway stop
openclaw gateway restart

# Full reinstall

openclaw gateway stop && openclaw gateway install && openclaw gateway start

# Live logs

tail -f ~/.openclaw/logs/gateway.err.log
```

If Gateway Won't Start	Check	Fix
Node.js missing	node --version	brew install node
API key missing	grep sk-ant ~/.openclaw/.env	Add key to .env
Port in use	lsof -i :3000	Kill conflicting process, then restart

04 Monitoring System

Two independent monitoring layers run simultaneously. Both alert to your Telegram bot.

Layer	What It Does	Access
VELA Health Check	Every 15 min via cron. Checks gateway process, port, disk space, API key.	~/.openclaw/scripts/monitoring/health_check.sh
Uptime Kuma	Continuous, every 60 sec. Visual dashboard with uptime history.	http://localhost:3001 (or Tailscale IP)

```
# View health check log
tail -50 ~/.openclaw/logs/health_check.log

# Run health check manually
bash ~/.openclaw/scripts/monitoring/health_check.sh

# Open Uptime Kuma
open http://localhost:3001
```

05 Remote Access (Tailscale)

Tailscale gives direct access to any client Mac Mini without requiring the client to be present or change firewall settings.

OPERATIONS & REFERENCE GUIDE

```
# Connect to client machine
ssh [username]@vela-[client_id]

# Check all machines on your network
tailscale status

# Restart gateway remotely
openclaw gateway stop && openclaw gateway install && openclaw gateway start

# Rotate Anthropic API key
NEW_KEY="sk-ant-..."
sed -i 's/sk-ant-[^"]*/$NEW_KEY/g' ~/.openclaw/.env
openclaw gateway restart
```

06 Google Drive Delivery

Every agent deliverable is automatically saved as a Word document and uploaded to the correct Google Drive folder. Delivery also posts a summary to the correct Telegram topic.

Agent	Telegram Thread
analyst	Thread 2
researcher	Thread 3
marketing	Thread 4
pm	Thread 5
legal	Thread 6

07 Troubleshooting

Problem	First Check	Fix
Drive upload failing	Check auth file exists	<code>cat ~/.openclaw/workspace-cos/scripts/.drive_auth.json</code>
High token costs	Check cacheRetention setting	Verify cacheRetention is short — never long
Health alerts not arriving	Confirm bot started in Telegram	Run <code>health_check.sh</code> manually to test
Tailscale not connecting	tailscale status	<code>sudo tailscale down && sudo tailscale up</code>
Disk space alert	<code>df -h ~</code>	<code>find /tmp/openclaw -name *.log -mtime +7 -delete</code>
Context too large	Force session reset	<code>rm -f ~/.openclaw/workspace-cos/session*.json</code> then gateway restart

08 Incident Response

Alert to resolution should take under 10 minutes for 90% of incidents.

Step 1 — The Alert @VELAMonitor_bot sends a Telegram message. Do not call the client. Start the protocol.

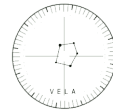

Step 2 — Check Uptime Kuma Open [http://\[tailscale-ip\]:3001](http://[tailscale-ip]:3001). Is it one service down or everything?

Step 3 — SSH In `ssh [username]@vela-[client_id]` via Tailscale.

Step 4 — Run Health Check `bash ~/.openclaw/scripts/monitoring/health_check.sh` — exact diagnosis.

Step 5 — Fix and Verify Apply fix. Confirm: `openclaw status`. Send status check in Telegram.

Failure Type	Fix
Gateway crashed (most common)	<code>openclaw gateway restart</code>
Gateway hung	<code>openclaw gateway stop && sleep 5 && openclaw gateway start</code>
Mac Mini went to sleep	System Settings → Energy → disable sleep, then restart gateway

Failure Type	Fix
Disk full	<code>df -h && find /tmp/openclaw -name *.log -mtime +7 -delete</code>
API key issue	<code>grep ANTHROPIC_API_KEY ~/.openclaw/.env</code>

Client Communication

"Brief interruption to your system this morning — identified and resolved. {{AGENT_NAME}} is back online. No action needed on your end."

Short. Confident. No technical detail. That is the VELA standard.
